INTRODUCTION

INTRODUCTION

About Cemintel®

Cemintel® is part of the Australian owned icon, CSR Building Products company, manufacturing and supplying cement panels and building systems used for external façades, internal linings, ceilings and flooring which are suitable for use in commercial and residential applications.

Cemintel® locally manufactures at Wetherill Park, NSW to AS/NZS 2908.2:2000. The factory utilises a full steel template process to produce a variety of fibre cement products. This method provides a smoother and flatter sheet than non-steels or sheet-on-sheet manufacture process, and sets the Cemintel® products apart from others in the market.

The factory at Wetherill Park has a strict testing regime that regularly checks raw materials and finished product to ensure compliance with AS/NZS 2908.2:2000. In addition, products are tested in accordance with asbestos identification to 'AS4964 – Method for the Qualitative Identification of Asbestos in Bulk Samples'.

Cemintel® has established global partnerships with leading manufacturers to obtain new product technology to meet our ever-changing market demands.

Products are covered by warranty to perform to relevant Australian Standards and Building Code requirements, and solutions are provided to meet fire, acoustic and thermal requirements to service all segments of the construction industry.

Products that are imported are subject to a strict testing protocol. While documentation is provided from the country of origin, independent testing is also conducted in Australia by a National Association Testing Authority (NATA) accredited company. Products are not released into the market until testing results are cleared.

With more than 20 years' history, Cemintel® has made some innovative contributions to the building industry including the introduction of CeminSeal® water block technology in 2010. Locally made Barestone™ products, a favourite of the design community, launched in 2012, and were quickly followed by other prefinished product ranges such as Territory™ and Surround™.

Products are available nationally through a significant distribution footprint. It is an agile business that works to add value through solving specific project and customer needs with technical support from Cemintel® via the DesignLINK® team.

Our Products

Fibre cement products are made from natural ingredients. [Ground Sand (Silica), Cement, Air, Water, Radiata Pine, Additives e.g. sealers]. Fibre cement does not contain magnesium chloride (salt).

Cement

Water & Air

Radiata Pine

Sand

Fibre cement products are deemed non-combustible according to the National Construction Code (NCC) Vol. 1 Section C1.12 and Volume 2 Section 3.7.1.2. Cemintel® fibre cement linings have been assessed with reference to AS3837 as Group 1 materials. Group 1 is the highest rating and allows the material to be used as a wall or ceiling lining in all building areas.

INTRODUCTION

Fibre cement products are becoming more popular in building due to a number of properties of the material:

- Durability
- Impact resistance
- Termite resistance
- Fire resistance
- Moisture resistance

In addition to these material properties, fibre cement products provide significant design flexibility.

- Material Choice.** With many different profiles, thicknesses, sizes, colour and textures available, they can be mixed and matched to produce amazing and beautiful buildings.
- Durable and low maintenance.** Fibre cement products do not swell or warp, especially when compared to timber. They also hold colour very well so they don't need frequent repainting which can happen with some other products such as timber and render products. Prefinished options are also available.
- Increased speed of construction & easy to install.** Fibre cement products and systems can increase speed of construction through less trades being required (eg bricklayers & brick cleaners) and scaffold hire reduction. This can assist reaching lockup stage sooner.
- Maximise Design Footprint.** With clever design, extra space can be added to the internal floor area, living and storage spaces from fibre cement construction. With products and systems that fix directly to the frame, this can reduce wasted space and walls can be thinner than traditional construction methods. As an example:

Material	Wall Thickness	Lost Space on 15m X 15m Slab (225m ²)
Double Brick		
Brick Veneer 90mm Stud 10mm Plasterboard		
Territory™ 16mm Panel 15mm Cavity 90mm Stud 10mm Plasterboard		

Asbestos

Cemintel® started manufacturing products at Wetherill Park, New South Wales, in 1996. This factory facility has never used asbestos to manufacture fibre cement products. The products are manufactured to AS/NZS 2908.2:2000.

The factory has a strict testing regime that regularly checks raw materials and finished products to ensure their compliance with the Standard.

Products that are imported also have a strict testing regime to ensure compliance with the Standard and Cemintel® quality requirements.

Both locally manufactured and imported products are tested in accordance with asbestos identification to "AS4964 – Method for the Qualitative Identification of Asbestos in Bulk Samples".

Should you require further clarification on asbestos, please contact Cemintel® on 1300 236 468.

INTRODUCTION

Sustainable Manufacturing

Cemintel® focuses on the following areas of sustainability in manufacturing:

Water/Solid Management	Water is a critical element to producing fibre cement, and requires sustainable and responsible water management systems. The vast majority of process water used during the manufacture process is recycled on site or taken off site to be converted into a soil conditioner or as a road base. Waste concrete can be used in landfill.
Recycling	At the end of each autoclave cycle, the used steam is either transferred to another autoclave for re-use or transferred into tanks, converted into condensate and cooled down with the aid of cooling towers. This water is eventually treated with the rest of the process water from other parts of the plant. This ultimately helps with reducing odour concentration and minimises potential emissions.
Lower Embodied Energy	Fibre cement has a significantly lower embodied energy than traditional masonry materials. According to Dr. Bill Lawson in his study into Building Materials, Energy and The Environment, the embodied energy of a timber frame, fibre cement weatherboard wall is 169 MJ/sqm*, whilst the embodied energy of a cavity clay brick wall is 860MJ/sqm*. Such factors are recognised worldwide and have led the Building Research Establishment in the UK to award wall systems using fibre cement cladding an A+ rating in its Green Guide to Specification. *Building Materials Energy and the Environment Towards Ecologically Sustainable Development, Dr Bill Lawson, 1996
VOCs	Prefinished products are coated with various sealers. The amount of VOCs is minimal and well within the levels recommended by the Green Building Council.

Building Product Conformance and Compliance

There is a high level of regulation within the building industry to help ensure buildings are constructed with compliant and conforming building materials. This has become an extremely important topic in Australia over the past couple of years due to issues with building products with poor fire properties and asbestos contamination in imported products. In addition to Building Product Conformance and Compliance, the industry has a strict regulatory

environment to ensure construction in Australia is safe and meets certain standards.

Below is some guidance from the 'Australasian Procurement and Construction Council – A guide on achieving compliance' which helps explain the interconnectedness of the regulatory bodies and product compliance requirements.

A copy of the complete guide can be downloaded from www.apcc.gov.au

National Construction Code (NCC)

The NCC is developed and published by the Australian Building Codes Board (ABCB). The NCC details the minimum necessary standards of performance for all buildings in relation to health, safety (including structural safety and safety from fire), amenity and sustainability.

The NCC series currently comprises of the following three volumes:

- Volume One: Building Code of Australia Class 2 to Class 9 Buildings.
- Volume Two: Building Code of Australia Class 1 and Class 10 Buildings.
- Volume Three: Plumbing Code of Australia

The Australian Government and all State and Territory Governments are signatories to an Intergovernmental Agreement which commits them to supporting the ABCB, and commits them to the adoption of the

NCC through their respective building and plumbing legislation.

The NCC calls up 'referenced documents' such as Australian Standards and some industry developed standards to provide technical details for the performance of construction products.

Construction work not covered by the NCC, such as infrastructure and unique structures, is subject to the standards nominated by the relevant designer/engineers and contract documentation.

In all cases, the relevant designer/engineer should nominate, through plans and specifications, those standards that must be met by the construction products used. The relevant designer/engineer should also specify what level of evidence should be accepted as proof that a building product meets the specified standard.

INTRODUCTION

The Building Code of Australia (BCA)

In respect to building product conformance, the BCA provides a framework for procurers to use by:

- setting an objective for the performance of a building
- setting out the relevant performance requirements for a building and its construction materials
- referencing relevant minimum technical standards for product performance.

For building Classes 2 to 9 (NCC Volume One), Part A2.1 of the BCA requires that:

Every part of a building must be constructed in an appropriate manner to achieve the requirements of the BCA, using materials that are fit for the purpose for which they are intended.

For building Classes 1 and 10 (NCC Volume Two), Part 1.2.1 of the BCA requires that:

Every part of a building must be constructed in an appropriate manner to achieve the requirements of the Housing Provisions, using materials that are fit for the purpose for which they are intended.

The BCA is referred to as a performance-based document in that it provides flexibility when designing a building. The performance requirements set out the minimum standards a building must achieve in relation to such things as the structure, damp and weatherproofing, fire safety, health and amenity, safe movement, access and egress and energy efficiency.

The flexibility allowed under the performance-based BCA means that constructors are not locked in to a specific construction method and are able to achieve compliance in several ways. To that end, the NCC allows for a number of methods to achieve a building solution, provided the method adopted complies with the performance requirements set out for each aspect of the design. The hierarchy of the BCA is shown below:

FIGURE 1.01 The Building Code of Australia Hierarchy

- **Level 1 (Objectives):** Statements that outline the reason/driver for the requirements of the Code.
- **Level 2 (Functional Statements):** Statements which describe how a building, in a functional sense, could fulfil the Objectives.
- **Level 3 (Performance Requirements):** Descriptions of the level of performance to be achieved by building products, design and construction, in order to satisfy the Functional Statements and Objectives.
- **Level 4 (Building Solutions):** An outline of two methods (the 'Deemed-to-Satisfy Provision' and the 'Alternative Solutions') that can be followed to demonstrate compliance with the Performance requirements in the BCA.

INTRODUCTION

Achieving a Building Solution

In designing and constructing an appropriate building solution that complies with the performance requirements in the BCA, one of two options must be followed:

Option 1: Deemed-to-Satisfy Provisions

The most common method to achieve a building solution is to adopt the Deemed-to-Satisfy Provisions which represent accepted compliance options for each Performance Requirement. Deemed-to-Satisfy Provisions are provided in both volumes of the BCA. In Volume One, there is only one option setting out the technical requirements as Deemed-to-Satisfy Provision. In Volume Two, there are generally two options – an ‘Acceptable Construction Practice’ (ACP) which is the technical information specified in the BCA or an ‘Acceptable Construction Manual’ (ACM) which generally includes reference to an Australian Standard for the particular building element (e.g. Part 3.4.3 Timber Framing refers to AS 1684.2-2010 Residential timber-framed construction – Non-cyclonic areas).

Option 2: Alternative Solutions

A Building Solution can also be achieved by way of an ‘Alternative Solution’ which meets the Performance Requirements. This performance-based concept allows for increased design scope and acknowledges that, while the objectives of the BCA need to be consistently met, there are multiple ways to do this. It is critical that any Alternative Solutions which rely on the procurement of construction products are clearly documented.

If a design or element of a design does not meet the Deemed-to-Satisfy Provisions, it can still comply with the BCA if it can be demonstrated that the Alternative Solution complies with the relevant Performance Requirements. This method, known as an Alternative Solution, is permitted to demonstrate conformance.

Evidence must be supplied to support the Alternative Solution, and that evidence must show how the use of a product or form of construction will meet the BCA performance requirements. There are a variety of assessment methods which can be used to determine the suitability of the alternative solution. These are set out in the BCA and include:

- Providing evidence to support that the product, form of construction or design meets a Performance Requirement (such as reports from Registered Testing Authorities – for example, Codemark).
- Providing Verification Methods such as a test, inspection, calculation or other method that determines whether a Building Solution complies with the Performance Requirements.
- Making comparisons with the Deemed-to-Satisfy Provisions that may be issued by the appropriate authority.
- Providing an Expert Judgement about the Alternative Solution.

When used, the Alternative Solution design, including how it purports to meet the relevant Performance Requirements, must be documented and included as part of the building permit application. It must be approved by the building surveyor or approving authority before work commences.

Local Government Requirements

In addition to the NCC and BCA requirements, local Government bodies are also involved with building regulation. The regulations that they are associated with can be broadly categorised as follows:

Development Control: Local councils have power over development assessments and are able to grant approval, grant approval with conditions, or refuse an application. The controls regulate allowable densities, height, external design and siting, building materials, open space provisions, and in some jurisdictions the level of developer contribution required to cover physical and/or community infrastructure costs arising from the proposed development. Local councils also have control over the demolition of buildings.

Land release/supply, subdivision control and infrastructure provision: The level of control over

subdivision varies between jurisdictions. Where local councils do have control, this includes discretion over engineering standards for roads, drainage, allotment size and, in some jurisdictions, water and sewerage arrangements. Although local government has a significant role in infrastructure provision, it plays a more limited role in relation to land release/supply and coordination, especially in the major capital cities.

Building regulation: Local government does not set building regulations, it administers them in accordance with the Building Code and planning and building by-laws (for example relating to matters such as bushfires, water, waste management, salinity and energy efficiency). Where applications do not conform with the building regulations they are generally rejected in the first instance.

INTRODUCTION

Fire

Cemintel® cladding, weatherboards and façade products are deemed as a non-combustible material in accordance with C1.12 and part 3.7.1.2 of the National Construction Code (NCC).

They are suitable for use where non-combustible building materials are required.

For residential buildings covered by Volume 2 of the NCC, clause 3.7.1.2 specifically indicates that fibre cement is suitable for use where non-combustible materials are required.

For residential and commercial buildings covered by Volume 1 of the NCC, clause C1.12 similarly indicates that fibre cement is suitable for use where non-combustible materials are required.

Fire testing has been carried out by independent industry Registered Testing Authorities (RTAs).

If you have specified fibre cement products previously, be assured that they meet the requirements of the NCC 2016 Building Code of Australia (BCA). The Code states as follows:

Objective

C01

The objective of this Section is to:

- a) safeguard people from illness or injury due to a fire in a building; and
- b) safeguard occupants from illness or injury while evacuating a building during a fire; and
- c) facilitate the activities of emergency services personnel; and
- d) avoid the spread of fire between buildings; and
- e) protect other property from physical damage caused by structural failure of a building as a result of fire.

Basis of Objective

This Objective is based on the belief that a building should:

- provide people with an environment which, during a fire, will minimise the risk of them suffering illness or injury;
- provide people with an evacuation route which will minimise the risk of them suffering illness or injury while escaping a fire;
- facilitate the role of emergency services personnel, such as the fire brigade, if it becomes necessary for them to undertake such operations as fire-fighting and search and rescue;
- assist in minimising the risk of fire spreading from one building to another; and
- not have a structural failure during a fire that results in damage to another building, allotment or road.

Non-combustible Materials

The BCA allows the use of fibre cement where non-combustible material is required under Vol 1, Section C1.12.

Cemintel® fibre cement achieves a '0' Flame Spread result (on a scale of 1 to 10 with 0 representing the best possible result) when tested in accordance with AS/NZS 1530.3. Under this test, fibre cement also achieves '0' for ignitability and heat evolved, and '0-1' for smoke developed.

Fire Resistance Levels (FRLs)

FRLs are measured in accordance with AS/NZS 1530.4. This method of testing is based on a full system as opposed to individual system components. Cemintel® products have been tested in multiple wall system configurations to determine the respective FRL of these systems. Refer to the 'Gyprock Red Book' for Fire and Acoustic Rated Walls or product specific Design & Installation Guides for further information.

INTRODUCTION

**Bushfire Attack Level (BAL) Rating**

A BAL rating is a means of measuring the severity of a building's potential exposure to ember attack, radiant heat and direct flame contact. It's measured in increments of radiant heat (expressed in kilowatts/m²).

A BAL is the basis for establishing the requirements for construction (under the Australian Standard AS 3959-2009 Construction of Buildings in Bushfire Prone Areas), to improve protection of building elements from bushfire attack.

Once assessed, your site/property/asset will be defined to one of six BAL ratings:

**BAL-FZ**

Direct exposure to flames from the fire front in addition to heat flux of greater than **40kW/m²** and ember attack.

BAL-40

Increasing levels of ember attack and ignition of debris with an increasing heat flux of up to **40kW/m²** and increased likelihood of exposure to flames

BAL-29

Increasing levels of ember attack and ignition of debris with an increasing heat flux of up to **29kW/m²**

BAL-19

Increasing levels of ember attack and ignition of debris with an increasing heat flux of up to **19kW/m²**

BAL-12.5

Ember attack with heat flux of up to **12.5kW/m²**

BAL-Low

There is insufficient risk to warrant specific construction requirements

- **BAL – Low:** There is insufficient risk to warrant specific construction requirements.
- **BAL – 12.5:** Ember attack.
- **BAL – 19:** Increasing levels of ember attack and burning debris ignited by windborne embers, together with increasing heat flux.
- **BAL – 29:** Increasing levels of ember attack and burning debris ignited by windborne embers, together with increasing heat flux.
- **BAL – 40:** Increasing levels of ember attack and burning debris ignited by windborne embers, together with increasing heat flux and with the increased likelihood of exposure to flames.

- **BAL – FZ:** Direct exposure to flames from fire, in addition to heat flux and ember attack.

The image above shows the various BAL ratings and the radiant heat flux for each rating. The greater the distance from the fire the lower the heat flux and therefore the construction standard is lower.

Where your building is greater than 100m from any classified vegetation the BAL rating will be BAL-Low and will not require any special construction requirements. Where there is a risk or potential that ember attack could affect your home we recommend that BAL – 12.5 is applied.

BAL ratings for all Cemintel® products are available for download at cemintel.com.au/technical

EAVES & SOFFITS
EAVES LINING SHEET

Specifically designed for use in the lining of residential eaves, Cemintel® Eaves Lining sheets are manufactured in Australia and are sized to suit standard eaves widths.

The joints are covered with H moulds or cover moulds.

The sheets should be coated with an exterior paint system for a durable, low maintenance lining.

EAVES & SOFFITS
EDGE CLADDING

A versatile product within the portfolio, Edge Cladding can be used in eaves, soffits and ceilings, as well as on internal and external walls.*

It is an efficient way to add a tongue and groove-like texture for visual interest, on both timber and steel frames.

FIGURE 2.04 Edge Cladding

FIGURE 2.05 Eaves Lining

115655*	9	1200	2750	12kg/m ²	30
115656*	9	1200	3000	12kg/m ²	30

*Customised solutions can be provided upon request. Please contact Cemintel® on 1300 236 468.

EAVES & SOFFITS SOFFITLINE®

This durable product can be used for internal and external soffits, eaves and ceiling applications where a flush joint appearance is required.

The panels are made in Australia and incorporate Cemintel's unique CeminSeal® water block technology that repels water and increases paint adhesion.

The 6mm thick panels are coated on all sides (including the back) which stops water soaking back into the ceiling. If water soaks back into the ceiling this can cause paint to bubble or blow off.

The panels have a recess on the edges for seamless jointing.

FAÇADES & CLADDING

FAÇADES & CLADDING – PREFINISHED BARESTONE™ EXTERNAL

Cemintel Barestone™ External panels provide a raw, contemporary finish. Its biophilic impression enhances design aesthetic as it weathers naturally and seamlessly blends into its environment.

Barestone™ External continues to be a very popular product. It is used in many diverse ways and can be cut in many different shapes and sizes for dramatic design effect.

The 9mm compressed panels incorporate Cemintel's unique CeminSeal® water block technology that repels water and they are manufactured in Australia.

The panels can be installed using the Cemintel Commercial ExpressWall® system using exposed fixing.

See 'Internal Linings' section for Barestone™ Internal (pg 65).

FIGURE 3.01 System Overview

Product Code	Thickness (mm)	Width (mm)	Length (mm)	Mass (Nominal)	Panels per pack
99487	9	1200	2400	17.8kg/m ²	20
99486	9	1200	3000	17.8kg/m ²	20

Barestone™ is subject to natural variation in colour and finish due to the manufacturing process and the raw materials used in its manufacture. The builder/installer must ensure the product meets aesthetic requirements before installation.

FAÇADES & CLADDING – PREFINISHED SURROUND™

A European manufactured, prefinished range that is expertly put together so that you can mix and match colours with confidence. Surround™ is a core range of neutrals and discrete patterns for buildings to look at one with their environment, taking references from the landscape and streetscape.

The colour-bodied (also known as colour through) panels come **trimmed and sealed** and can be installed in a horizontal or vertical orientation using the Cemintel Commercial ExpressWall® TopHat fixing system.

Colour matched rivets accommodate the differential movement between the building structure and the façade. They also provide a more seamless aesthetic to your project.

Only one rivet type is used to install the panels removing potential for costly errors.

As Surround™ is a prefinished product, product images may vary from the actual product in regard to colour and surface finish. Panels should be inspected by the builder/installer prior to installation to ensure they meet aesthetic requirements.

PREFINISHED – FAÇADES & CLADDING

TERRITORY™ FEATURING DESIGNER SERIES FIXING SYSTEM

URBAN GREY // WEST LAKES // SA

Cemintel Territory™ is a natural cladding range that comes from Japanese values of simplicity, nature and quality. It is a building block to your home style.

The prefinished cladding panels simulate materials like stone, timber, concrete, metal, tiles and smooth render in a sophisticated way to enhance building façades without the ongoing maintenance requirements.

Panels are factory quality controlled, and the system has Codemark accreditation under Certificate of Conformity CM300.48.

The simple, concealed clip fixing system goes together like meccano once the starter strip is installed. Panels can be installed horizontally or vertically, and the system provides a ventilated cavity to keep your building dry.

Nichiguard® stain resistant and self cleaning coating is available on all panels. Additional Platinum Coating technology protects against UV damage and colour fade.

Territory™ panels are machined with a complementary tongue and groove profile that easily fit together.

A compressible sealing strip is factory bonded onto the tongue profile to form a weather resistant joint.

The system has a choice of simple aluminium or colour matched, pre-formed corners to suit your desired aesthetic.

^ There will be a transition from 320ml cartridge sealants to 500ml sausages. The formulation of the sealant is unchanged, it is a packaging change only. The transition is scheduled to commence on 1/4/18 however, depending on stock levels and demand, please appreciate that the changeover could happen for some products before or after this date.

* Use for nail heads, cut edges at window heads and other visible blemishes.

MODERN CLADDING – FAÇADES & CLADDING ASPECT CLADDING®

The 300mm wide Cemintel Aspect Cladding® panel displays a single and visible 16mm wide groove, providing easy coverage for an attractive façade.

The overlapping joint means less fixings than traditional weatherboards with no visible face fixings, providing a clean and modern finish. Aspect is available with direct or cavity fixing options.

The product is suitable for horizontal or vertical installation.[^]

It is gun nailable and has a smooth, pre-primed face ready to paint.

[^] If using vertically, sufficient frame support needs to be incorporated into the design. Customised solutions can be provided upon request. Please contact Cemintel®.

MODERN CLADDING – FAÇADES & CLADDING EDGE CLADDING

This is a hidden gem in the Cemintel® portfolio. A pre-primed, external vertical cladding panel with sharp grooves allows for creative application of the product that pairs fantastically with the whole Cemintel® range.

The grooves are very sharp and clean so you don't have to remove burring before you paint – it's ready to go.

The panels are gun nailable to provide speedy construction and good coverage. The direct fix method saves space and time.

The ship-lap joint runs along the long edge, and allows for frame movement and avoids joint cracking. It can be installed direct on studs or as a cavity system.

Edge can also be used in customised solutions* for eaves, ceilings, soffits and internal linings.

See relevant sections for more information or contact Cemintel®.

MODERN CLADDING – FAÇADES & CLADDING COMMERCIAL EXPRESSPANEL®

WOLLI CREEK // NSW

Cemintel Commercial ExpressPanel® is an ideal façade solution for commercial and industrial applications.

In conjunction with the Commercial ExpressWall® system, this combines a modern, express jointed aesthetic with a fast and economical top hat installation system.

With pre-primed, multiple sized sheets available and ready for painting, the panels can be arranged in a variety of patterns. Play with colours on its surface for a unique finish to add a different dimension, especially to large scale multi-res apartments.

The 9mm compressed panels are strong and offer good impact resistance and can withstand high wind loadings, including cyclonic conditions.

Made in Australia for Australian conditions.

MODERN CLADDING – FAÇADES & CLADDING MOSAIC®

Mosaic® combines a modern, geometric express joint aesthetic making it the ideal façade for the modern home. Multiple sized panels can be arranged to form a pattern effect either using block colour or a variety of tones using a painted finish.

The pre-primed, nailable panels are fast and easy to install over either timber or steel frames with a batten system.

MODERN CLADDING – FAÇADES & CLADDING SCARBOROUGH® WEATHERBOARDS

A modern take on the traditional weatherboard, Scarborough® is a very stylish product. With strong shadow lines, this product allows designers to create both traditional and contemporary residential designs.

Scarborough® has a concealed fixing system and square profile so the boards butt together and provide a flat surface finish. The pre-primed boards are also able to be cut at different lengths to minimise waste.

From a design perspective, the 12mm thick profile provides sharp lines with a strong shadow line. This flexibility has enabled it to transcend from traditional homes to some funky and more upmarket projects.

The nail groove reduces the thickness to 8mm for ease of nailing and keeping accuracy.

The product is gun nailable for quick and easy installation. The product can be either direct fixed or installed with a vertical cavity.

One of the best features of Scarborough® Weatherboards is its low maintenance, especially compared to natural timber products.

MODERN CLADDING – FAÇADES & CLADDING SIMPLELINE®

While SimpleLine® may sound simple, it is more intelligent than you might think!

From an aesthetic viewpoint, it has strong, clean edges that provide for a linear recessed panel look without the cost. It can also be used in either a horizontal or vertical format* giving even more design flexibility.

The Australian manufactured panels have ship-lapped vertical edges that are suitable for gun-nailing for fast installation. There are multiple installation methods to give you choice and flexibility including direct fix or ventilated cavity options.

The product can be used as cladding on stage and zero lot walls, and boundary walls.

It is a simple blank canvas primed and ready for a final paint finish. It has an easy over-lap joint that does not need to be set to save you installation time and money.

OTHER CLADDING – FAÇADES & CLADDING CLADDING SHEET

A more traditional product, Cemintel® Cladding provides a lightweight panel solution in a most simple form.

The panels are manufactured in Australia. They are both clean and smooth, not furry – this enables them to be paint ready and ultimately provide a better painted finish.

It is very easy to install with traditional nail-on-frame methods. There is also an option for a drained cavity cladding solution.

The square edge panels are available in a range of sizes making it versatile in application and minimises waste. Joints can be covered with PVC moulds or timber.

OTHER CLADDING – FAÇADES & CLADDING COMMERCIAL RENDALINE®

Cemintel Commercial RendaLine® is a complete external cladding system that incorporates all the advantages of lightweight construction with a flush-jointed, texture coat finish.

A highly adaptable system, it can be used over most common structural materials such as masonry, pre-cast concrete and steel or timber stud framing in commercial and industrial buildings.

FAÇADES & CLADDING – OTHER CLADDING

ENDEAVOUR® WEATHERBOARDS

Endeavour® is a traditional weatherboard creating a linear, flat feature with a slight bevelled detail. Each board is touched by the hand of man ensuring quality is to a high standard before it leaves the factory.

This pre-primed weatherboard is a double width board which provides a faster installation. It has an overlap that minimises visible fasteners, giving the final paint finish a smooth appearance.

Endeavour® is gun nailable and can be installed directly to the frame or with a ventilated cavity.

FAÇADES & CLADDING – OTHER CLADDING

HEADLAND® WEATHERBOARDS

One of the more traditional weatherboards, Cemintel Headland® has a sharp edged and linear recess. It provides a classic Australian feel and lets you create a variety of stand alone or composite designs. This profile is fixed in a ship-lapped manner and is simple to install.

The weatherboard has a 25mm overlap which conceals fixings and they are gun nailable. The panels are pre-primed and ready for painting to finish your project in your personal style. Choose between a direct fix or ventilated cavity installation option.

FAÇADES & CLADDING – OTHER CLADDING PLANK

Cemintel® Plank provides a flexible, external cladding option for homes. It can be used as a complete external cladding system or for a second storey addition.

The attractive Smooth and Woodgrain finishes provide flexibility. They are available in two widths and can be painted to create your desired finish. The look is completed with a noticeable shadow line from the plank overlap.

The planks provide for fast coverage as they can be nailed directly to the frame or onto battens providing a drained cavity solution.

FAÇADES & CLADDING – OTHER CLADDING

TEXTURE BASE SHEET AND COATING SYSTEM

Cemintel® Texture Base panels, commonly referred to as 'Blueboard', provide a substrate for a smooth, monolithic surface when utilising textured finishes.

The products are generally used to provide a lightweight solution for second storey residential construction above masonry.

FLOORING & DECKING

FLOORING & DECKING CERAMIC TILE UNDERLAY

04

Cemintel's® Ceramic Tile Underlay is manufactured in Australia and is for internal use. It is easily installed with a pre-printed nail pattern guide and is a cost effective way to form a flat substrate for laying ceramic tiles over existing floors.

The product provides a thinner solution for a tile substrate that minimises the impact to your floor levels to surrounding areas.

It is an effective option to use over tongue and groove hardwood floors when it's time to tile over them.

// Pre-printed nail pattern guide

FLOORING & DECKING
COMPRESSED SHEET

Australian manufactured Cemintel® Compressed sheets are tried and proven for long term strength.

Reserved for use in tough conditions including wet area flooring and decking, the panels can be covered in tiles and other floor coverings. The products are manufactured in Australia.

FLOORING & DECKING CONSTRUCTAFLOOR®

Cemintel Constructafloor® is a gun nailable, fibre cement structural flooring product. The product comes in an internal and external version.

The panels have a tongue and groove joint which keeps stability between joists and reduces the risk of membrane cracking. They do not contain any magnesium chloride (salt) which can lead to rusting of fittings and steel frames.

The product can provide a seamless flow from room to room as it keeps the same floor level. This means no need to do cut outs. As the product is nailable, installation can be faster as no countersinking is required.

INTERNAL LININGS

INTERNAL LININGS BARESTONE™ INTERNAL

05

EMMANUEL COLLEGE
WARRNAMBOOL // VIC

Cemintel Barestone™ Internal provides a raw, contemporary finish for an internal application in a prefinished, lightweight panel product.

The product has a highly effective stain resistant coating applied to combat standard household items such as oils, wine and food.

Installing internally is simple with the product able to be adhered either directly to timber or steel battens, or alternatively, and for a more industrial look, exposed screw fixed.

FIGURE 5.01 System Overview
– Exposed screw fix method

INTERNAL LININGS CEMINSEAL® WALLBOARD

CeminSeal® Wallboard is the flagship product of the business and manufactured in Australia. It is a superior wet area internal lining and tile substrate product designed and tested for compliance and peace of mind.

Cemintel's unique CeminSeal® water block technology repels water and increases paint adhesion. It has been applied to the face of the panel and been tested to show increased water resistance as water beads instead of soaking in.

The smooth finish of CeminSeal® Wallboard is due to Cemintel's® unique full steel template manufacturing process. The smoother the finish of the board means less work for the contractors for fixing and setting. At the same time, it provides an excellent paintable surface.

CeminSeal® Wallboard is available in either recessed edge or square edge options.

The product is suitable for impact resistance in environments such as schools and hospitals.

INTERNAL LININGS EDGE CLADDING

05

This is a hidden gem in the Cemintel® portfolio. A pre-primed, external vertical cladding panel with sharp grooves allows for creative application of the product that pairs fantastically with the whole Cemintel® range.

The grooves are very sharp and clean so you don't have to remove burring before you paint – it's ready to go.

The panels are gun nailable to provide speedy construction and good coverage. The direct fix method saves space and time.

The ship-lap joint runs along the long edge, and allows for frame movement and avoids joint cracking. It can be installed direct on studs or as a cavity system.

Edge can also be used in customised solutions* for eaves, ceilings, soffits and internal linings.

See relevant sections for more information or contact Cemintel®.

FIGURE 3.24 Typical Direct Fix System

INTERNAL LININGS

TERRITORY™ FEATURING DESIGNER SERIES FIXING SYSTEM

Cemintel Territory™ is a natural cladding range that comes from Japanese values of simplicity, nature and quality. It is a building block to your home style.

The prefinished cladding panels simulate materials like stone, timber, concrete, metal, tiles and smooth render in a sophisticated way to enhance building façades but without the ongoing maintenance. The product can be installed vertically or horizontally.

FIGURE 5.06 Horizontal Installation

As Territory™ is a prefinished product, product images may vary from the actual product in regard to colour and surface finish. Panels should be inspected by the builder/installer prior to installation to ensure they meet aesthetic requirements.

Please refer to Section 04 pages 29-34 for Territory™ product information and the Territory™ Internal Design and Installation Guide.

	455 (effective coverage)		

AIR BARRIER

AIR BARRIER RIGID AIR BARRIER™

This product is a 6mm, square edged fibre cement panel that is sealed on the face and edges using CeminSeal® waterblock technology.

Air barriers are an integral component of a pressure equalised façade system. Pressure equalised systems consist of a cladding or rain screen installed with a ventilated cavity and form an effective method of weatherproofing buildings. For ventilated cavity system installations where wind loads exceed 1.5kPa, Cemintel® recommends that a Rigid Air Barrier™ be used instead of wall wrap.

SAFETY, HANDLING &
GENERAL CARE

SAFETY, HANDLING AND GENERAL CARE

Safety, Handling and General Care

Cemintel®, part of CSR Building Materials, has a very strong safety culture. As an employer, it wants to ensure that all employees are able to work in a safe environment so that they return home every day. Further, it is committed to providing recommendations for the safe use of our products. This is for the safety of people that handle, transport, install and live with Cemintel® products.

Health, Safety and Personal Protection Equipment (PPE)

Panels contain silica (commonly known as sand) that are harmful if inhaled.

Silica is commonly found in building products like concrete, bricks and glass and all fibre cement products. People come into contact with silica everyday as it is commonly used in building products.

When silica is intact, it is harmless. When it is cut or drilled however, fine particles are released and can be inhaled into the lungs. Breathing in excessive amounts of this respirable silica can cause a potentially fatal lung disease known as silicosis, and other potential diseases.

Cemintel® recommend practices to minimise the risk of harm from silica.

Cutting

Protective clothing and breathing equipment should be worn when cutting products.

When cutting, sanding drilling, grinding or other machining, you should always wear a P1 or P2 respirator and advise others in the immediate area.

When cutting fibre cement indoors, you should use the following implements:

- Score and snap knife
- Hand guillotine
- Fibre Shears (manual, electric or pneumatic)

When cutting outdoors, always ensure the work area is properly ventilated. Position the cutting station so wind will blow dust away from the user or others in the working area.

- Use a dust reducing plunge saw equipped with a dust extraction system.
- An approved dust mask (AS1715 and AS1716) and safety glasses (AS1337) must be worn.
- Hearing protection should also be worn.

Safety Data Sheet information is available at cemintel.com.au/technical

Storage

Products should be stacked flat clear of the ground and supported at 300mm maximum centres on a level platform.

Products must be kept dry, preferably stored inside the building. Panels must be dry prior to fixing, hence if it is necessary to store outside, the product must be protected from the weather by a waterproof covering.

Handling

Plank Products:

- Do not lift planks in the middle
- Carry planks on their edge
- If only one person is carrying a plank product, hold it in the middle and spread arms apart to better support the product.
- If two people are carrying a plank product, hold it near each end and on edge.

Panel Products

- Carry with two people
- Hold panel
- When handling panel products, exercise care to avoid damaging the corner

Prefinished Products

- Panels and corners must be treated with care during handling so as to avoid damage to edges, ends and the prefinished surface
- Panels should be carried horizontally on edge by two people.
- Consideration should be given to the activity of other tradespeople, in particular, a brick cleaner. It is highly recommended that installation of prefinished products be held off until the process of brick cleaning has been completed so as to avoid damage.

Important Reminders

1. **NEVER** use a power saw indoors.
2. **NEVER** use a saw blade that is not purpose-made for cutting fibre cement products.
3. **NEVER** dry sweep.
4. **ALWAYS** follow tool manufacturers' safety recommendations.
5. **ALWAYS** maintain tools in a clean condition.
